

Golden Forests Group

Agroforestry Intelligence

Business Prospectus

A dual-crop agroforestry platform combining premium Philippine mango production with long-duration agarwood value creation.

Business overview for professional clients, strategic partners, and prospective investors

This prospectus is a business overview and discussion document. It is not an offer document, private placement memorandum, subscription document, prospectus for securities-law purposes, financial promotion, or invitation to subscribe for securities. Any investment in the company or any related vehicle would be made only through definitive legal documentation and after appropriate legal, tax, regulatory, and professional advice.

Business Highlights

Business	Golden Forests Group is a Philippine-focused agroforestry and premium natural-products platform.
Core proposition	Dual-crop strategy combining earlier premium mango harvest activity with long-duration cultivated agarwood value creation.
Market opportunity	Agarwood targets oud, fragrance, incense, and luxury aromatic markets; mango targets premium Philippine fruit, export-quality produce, and branded fresh-produce channels.
Product pathways	Agarwood: oud wood chips as the current income basis, with other aromatic products treated only as potential future optionality. Mango: premium fresh fruit, export-quality mangoes, branded Philippine produce, and potential value-added products.
Operating platform	Nursery propagation, plantation establishment, field management, crop science, traceability, reporting, harvest preparation, and buyer-channel development.
Philippines advantage	Zambales climate supports Sweet Elena mango; Negros climate supports Aquilaria crassna agarwood. Both provide credible sites for field execution and investor visits.
Why it is differentiated	Golden Forests is positioned as a branded natural-products and agroforestry platform rather than a single-crop plantation scheme.

Investment thesis in brief: *Golden Forests is designed to make long-duration agroforestry more investable by pairing a premium, earlier-yielding mango crop with the potential upside of cultivated agarwood, supported by disciplined operations, traceability, sustainability discipline, product pathways, and experienced leadership.*

Illustrative \$100,000 Investment Highlights

The following examples are included to help readers understand the illustrative economics of the agarwood, mango, and combined portfolio models. They are based on the summary yield, price, timing, deduction, and commission assumptions shown below and should not be read as forecasts, guarantees, or commitments. Actual outcomes would depend on plantation performance, survival rates, product quality, export sales, market pricing, operating costs, taxes, fees, regulatory approvals, and legal documentation.

Agarwood	Mango	Combined Portfolio
17.8% illustrative annualized IRR	14.9% illustrative annualized IRR to year 15	12.9% illustrative annualized IRR to year 15
\$416,336 illustrative net income over 10 years	\$705,594 illustrative net income to year 15	\$514,061 illustrative net income to year 15
5.16× capital · 331 trees	8.06× capital · 229 trees	6.14× capital · 220 + 77 shares

Year 0	Years 5–8	Years 9–10	Years 11–15	Years 16–25
Capital deployed into managed tree-equivalent shares.	Mango harvests begin and ramp annually.	Agarwood resin harvest expected across two seasons.	Mango income continues; combined portfolio shows blended 15-year profile.	Mango remains the recurring long-duration income component.

Key Assumptions

Assumption	Agarwood	Mango
Capital	\$100,000	\$100,000
Units	331 agarwood trees	229 mango trees
Harvest timing	Years 9–10	From year 5 annually
Yield	1.75 kg/tree	30 kg/tree, rising to 100 kg/tree at peak-year 10
Price	USD 775/kg today; 3% p.a. to USD 984.25/kg by year 9	USD 4.00/kg today; 3% p.a. to USD 4.60/kg by year 5
Commission	10% of gross harvested income	20% of gross harvested income after deductions
Costs / deductions	Reserve funding for inoculation, harvest, extraction, and packaging	Packaging, cold storage, export certification, audit, and related costs deducted from mango harvest income

Assumption note: the figures above are simplified summary assumptions used to explain the illustrative investment examples. They are not guaranteed operating results and should be confirmed against final legal, financial, agronomic, tax, and market documentation before any reliance is placed on them.

Portfolio rationale: mango introduces earlier annual crop income from year 5, agarwood provides a higher-value harvest event in years 9–10, and the combined model is designed to blend income timing, crop exposure, and commercial resilience.

Executive Overview

Golden Forests Group is building a specialist agroforestry platform in the Philippines focused on the cultivation, management, traceability, and commercialisation of two complementary crops: agarwood and premium mango. The business combines long-duration biological-asset value creation with earlier commercial activity, creating a more balanced model than a single-crop plantation structure.

The company's core proposition is simple: develop a disciplined, science-led agroforestry business that can produce premium agricultural and aromatic natural products while supporting reforestation, local employment, field-level traceability, and responsible plantation management. The prospectus is designed for professional clients, potential commercial partners, and investors in the company who want to understand the business model, the market logic, the operating platform, and the leadership team.

About Golden Forests

Golden Forests Group is being developed as a specialist agroforestry and premium natural-products company with its operating focus in the Philippines. The company is designed to cultivate, manage, document, and commercialise high-value biological assets across agarwood and premium mango, supported by nursery development, plantation management, crop science, field reporting, traceability, sustainability ambition, and route-to-market planning.

Company Focus	Golden Forests Positioning
Core activity	Development and management of a dual-crop agroforestry platform focused on agarwood and premium mango.
Operating geography	Philippines, with a strategic focus on Zambales and Negros Island for nursery, plantation, and field operations.
Commercial identity	Premium natural-products company combining oud / agarwood exposure with branded Philippine mango potential.
Execution model	Nursery propagation, planting, field management, biological-asset reporting, harvest preparation, and buyer-channel development.
Stakeholder appeal	Professional clients, family offices, strategic agriculture groups, impact-oriented investors, commercial partners, and prospective company investors.
Differentiation	Dual-crop timing, traceability, crop-specific expertise, sustainability positioning, and a platform narrative broader than single-crop plantation exposure.

Vision, Mission and Core Values

Vision: To advance sustainable agroforestry in Asia through disciplined cultivation, scientific research, and technology-enabled operations.

Mission: To deliver real-economy harvest income from premium long-cycle crops while building enduring value for shareholders, ecosystems, and the communities Golden Forests serves.

Stewardship	1:1 native reforestation ambition and responsible land stewardship.
Scientific rigor	CITES-certified agarwood genetics, crop science, inoculation know-how, and university-linked research.
Innovation	AI, drones, GIS, sensors, and field data used to convert plantation activity into timely operational decisions.
Integrity and transparency	Independent reporting, traceability, mapped inventory, and professional governance standards.

Company Structure and Strategic Positioning

Golden Forests has been developed as a multi-jurisdictional agroforestry platform, with strategic oversight through an Abu Dhabi and Singapore holding structure, professional client distribution through private placement intermediaries, investment exposure through ring-fenced Singapore VCC sub-funds, and plantation execution through the Philippine operating company. This structure is designed to separate governance, distribution, capital allocation, and field execution while keeping the underlying business anchored in real agricultural production.

Layer	Purpose
Holding company	Ownership, strategy, oversight, and long-term platform development.
Professional distribution	Private placement intermediaries may present legal offer documents to eligible professional clients in approved jurisdictions.
Investment fund	Ring-fenced Singapore VCC sub-funds support distinct agarwood and mango exposure.
Operating company	Philippine plantation execution, permits, nurseries, field operations, harvest preparation, and local staffing.

The Business Model

Golden Forests operates as an integrated agroforestry platform rather than a passive landholding company. Its model covers nursery development, planting, field management, biological-asset monitoring, harvest preparation, post-harvest handling, and commercial channel development. Value is intended to come from execution discipline over time: selecting appropriate planting material, maintaining plantations properly, protecting crop health, documenting field activity, and preparing product for premium buyer channels.

- **Nursery and propagation:** development of planting stock for agarwood and mango, including nursery management and quality control before outplanting.
- **Plantation establishment:** land preparation, planting, irrigation, maintenance, crop protection, and field supervision.
- **Biological-asset management:** ongoing monitoring of survival, health, growth, yield readiness, and harvest timing.
- **Traceability and reporting:** use of field records, mapping, GPS-referenced data, and operational reporting to support transparency and control.
- **Commercialization:** preparation for mango sales through premium food channels and agarwood sales into legal, traceable oud and aromatic-product markets.

Why Agarwood

Agarwood, also known as oud, is a rare aromatic resinous wood produced by *Aquilaria* trees and used in luxury fragrance, incense, religious and cultural ceremonies, gifting, traditional wellness products, and premium aromatic materials. Its appeal is not limited to forestry: oud is a recognised luxury ingredient across Middle Eastern and Asian consumer markets, where fragrance houses, incense producers, collectors, and specialist buyers value resin content, aroma profile, provenance, and legal documentation.

The market case for agarwood is shaped by a structural supply-demand imbalance. Natural agarwood formation is rare, wild sources have been heavily pressured by overharvesting and illegal collection, and international trade is regulated under CITES because *Aquilaria* species are conservation sensitive. This has increased the strategic relevance of cultivated plantation supply that can demonstrate species identity, legal origin, chain of custody, controlled inoculation, and compliant export documentation.

For Golden Forests, this creates a clear commercial thesis: cultivated *Aquilaria crassna* can serve a premium oud market that increasingly requires traceability, legality, and repeatable quality. The company's current agarwood income model is based on producing documented oud wood chips for specialist buyers; references to oil, incense, fragrance ingredients, or branded aromatic products should be understood as potential future optionality, not the present commercial focus.

For Golden Forests, agarwood represents the long-duration value-creation component of the platform. The crop requires patience, scientific oversight, cultivation discipline, and controlled processing. That longer development cycle is precisely why it should be managed within an institutional operating framework: the future value depends on what happens in the nursery, in the field, during inoculation, and at harvest.

Technical Credibility — Agarwood

Golden Forests' agarwood proposition is based on managed *Aquilaria crassna* cultivation, controlled field establishment, monitoring of tree health and growth, inoculation readiness, resin development, harvest planning, and documentation of

legal origin. The commercial objective for the current model is to produce traceable cultivated oud wood chips; other agarwood-derived products may represent future optionality but are not the basis of the illustrative income returns.

Agarwood Demand Driver	Why It Matters for Golden Forests
Luxury oud and fragrance demand	Supports premium pricing potential for resin-rich, well-documented agarwood products.
Asian and Middle Eastern consumption	Provides access to established cultural and commercial demand for oud, incense, and aromatic wood.
Constrained wild supply	Increases the relevance of cultivated plantation supply and documented legal origin.
CITES-regulated trade	Makes compliance, traceability, and documentation central to market access and buyer confidence.
Processing and product optionality	Reinforces the primary commercial focus on oud wood chips while preserving potential future optionality for other agarwood-derived products.

Why Mango

Mango gives the platform a different and highly valuable commercial profile. Unlike agarwood, mango is a familiar food crop with a recognized consumer market, clearer route-to-market options, and the potential for earlier recurring harvest activity once trees mature. Philippine mangoes are widely associated with sweetness, eating quality, and export appeal, while the Sweet Elena mango story gives Golden Forests a premium varietal narrative linked to Zambales provenance and high-quality Philippine fruit.

The demand case for mango is supported by consumer familiarity, premiumization in fresh fruit, demand for reliable export-grade supply, and the ability to build brand value around origin, sweetness, harvest discipline, and post-harvest quality. Mango also provides a more accessible income story: once productive, the orchard model can support annual harvest cycles, buyer relationships, packaging standards, cold-chain planning, and repeat commercial activity.

Golden Forests’ mango positioning is strengthened by the use of Dwarf Sweet Elena Carabao mango, a premium variety produced from Carabao mango seedlings grafted with Elena bud stock and managed through dwarfing techniques. This supports a differentiated orchard proposition: premium fruit genetics, high-density planting potential, easier orchard management, and a clearer branded produce story than commodity mango production.

The mango sleeve is strategically important because it helps make the business easier to understand. It introduces a premium food-product story, creates potential earlier operational milestones, and broadens the platform beyond a single long-duration specialty wood crop. It also allows the company to build commercial relationships,

logistics capability, post-harvest handling discipline, and buyer channels that may strengthen the overall operating platform.

Technical Credibility — Mango

Golden Forests’ mango proposition is based on Dwarf Sweet Elena / Carabao mango positioning, controlled nursery propagation, grafting discipline, orchard establishment, pruning, crop protection, yield ramp management, harvest handling, sorting, packaging, and quality control. The commercial objective is to develop premium Philippine mango supply suitable for domestic premium channels, export-quality fruit programs, and branded produce relationships.

Mango Demand Driver	Why It Matters for Golden Forests
Premium Philippine mango reputation	Supports brand positioning around sweetness, quality, and export-grade fruit.
Sweet Elena / Carabao varietal story	Gives the company a differentiated product narrative linked to Zambales and premium mango cultivation.
Consumer food-market familiarity	Makes the mango sleeve easier for clients, investors, and partners to understand.
Recurring harvest profile	Provides an annual income narrative that complements the longer agarwood cycle.
Export and distribution potential	Creates opportunities for commercial channels into domestic premium fruit, export markets, and branded fresh-produce relationships.

The Dual-Crop Strategy

The most compelling feature of the Golden Forests model is the combination of agarwood and mango in one agroforestry platform. Agarwood offers long-duration specialty value; mango offers a more familiar premium food crop with earlier commercial activity. Together, they create a more balanced business narrative than either crop could provide alone.

Crop	Strategic Role	Business Benefit
Agarwood	Long-duration aromatic wood and oud exposure	Specialty-market upside, scarcity premium, and traceable cultivated supply positioning
Mango	Premium food crop with earlier harvest profile	Consumer familiarity, earlier commercial milestones, and recurring crop-management discipline
Combined platform	Dual-crop agroforestry system	Diversified crop timing, broader market story, operational resilience, and stronger investor communication

Dual-crop strategy summary: mango supports earlier operating activity; agarwood supports longer-duration specialty-market value.

Why the Philippines

The Philippines offers a credible operating base for Golden Forests because the country combines tropical crop suitability, recognized mango provenance, agricultural labor capability, export orientation, and practical access to Asian and Middle Eastern commercial channels. Zambales is strategically important for the Sweet Elena / mango, while Negros Island provides additional operating geography for nursery and agarwood plantation development.

Location Factor	Relevance to Golden Forests
Zambales mango provenance	Supports the Sweet Elena mango narrative and premium Philippine fruit positioning.
Negros operating geography	Provides additional nursery and agarwood plantation development capacity and geographic operating diversity.
Tropical crop suitability	Supports both mango orchard development and Aquilaria crassna cultivation under managed conditions.
Export orientation	Allows the company to prepare for premium fruit channels and legal aromatic-material export pathways.
Site-visit potential	Gives professional clients, partners, and investors a practical way to inspect field operations and build confidence in execution.

Platform Readiness

Golden Forests is not presented as a purely conceptual idea. The company has developed an operating base in the Philippines, with management indicating active nursery operations, planting inventory, permitting progress, land-access arrangements, and crop-specific leadership. Its dual-crop planting strategy is built around agarwood and Sweet Elena mango, supported by field-level traceability through mapping, records, and reporting systems. This matters because agroforestry value is created through physical execution over time, not simply through an investment thesis.

Readiness Area	Why It Matters
Philippine operating base	Provides a local execution platform for nursery, field, permitting, staffing, and plantation management.
Nursery activity	Supports control over planting stock quality and staged plantation expansion.
Crop-specific leadership	Connects strategic planning with practical agronomy, forestry, and mango cultivation expertise.
Traceability ambition	Helps professional stakeholders understand tree inventory, field progress, and operating milestones.

Operational Approach

The company's operating approach is based on disciplined execution across the full plantation lifecycle. The goal is to reduce avoidable execution risk by combining agronomic planning, field supervision, crop-specific expertise, and documentation. For agarwood, this includes propagation, planting, growth monitoring, inoculation readiness, and harvest preparation. For mango, it includes nursery quality, grafting, orchard establishment, pest and disease management, pruning, yield development, harvest handling, and route-to-market preparation.

Golden Forests intends to build institutional-style reporting around biological assets. This includes maintaining records of planting blocks, tree counts, field condition, crop progress, harvest readiness, and material operating events. The practical purpose is to make the business more transparent, auditable, and understandable for sophisticated stakeholders.

Technology and traceability: Golden Forests intends to use AI-enabled crop monitoring, drones, GIS mapping, soil and climate data, timestamped inspections, and annual reporting to make plantation performance more visible, auditable, and actionable.

Commercial Readiness by Crop

Readiness Area	Agarwood	Mango
Planting material	Healthy <i>Aquilaria crassna</i> seedlings held in nursery inventory for planting, with species documentation and records maintained.	Healthy Dwarf Sweet Elena mango seedlings held in nursery inventory for planting, with grafting quality and nursery records maintained.
Field execution	Land secured for agarwood planting, with due diligence completed on soil, land suitability, topography, and climate conditions.	Land secured for mango planting, with due diligence completed on soil, land suitability, climate, orchard layout, and field conditions.
Harvest and processing	Exclusive license secured for proven <i>Aquilaria crassna</i> inoculation technology, supporting resin development, harvest planning, grading, and processing.	Detailed procedures secured for mango harvesting, handling, sorting, grading, packaging, and post-harvest quality control.
Market access	Significant market, pricing, and buyer research completed for oud wood chips, incense markets, fragrance inputs, and legal export pathways.	Significant market, pricing, and buyer research completed for premium domestic mangoes, export-quality channels, and branded produce relationships.
Stakeholder confidence	Agarwood permits in place, supported by DNA traceable cultivated supply, CITES-aware	Sweet Elena mango has a proven track record for sweetness, market acceptability, and high

	documentation, field reporting, and clear harvest assumptions.	Brix content, supported by Philippine provenance and harvest reporting.
--	--	---

Risk Mitigation and Client Visibility

Risk-Control Feature	Prospectus Message
Surplus planting buffer	Golden Forests maintains a 20% buffer of agarwood and mango trees for each planting year to replace mortalities and provide a 100% mortality guarantee, except in force majeure circumstances.
Conservative yield assumptions	Illustrations use stated yield and price assumptions, including an 80% fruiting assumption for mango, allowing for a 20% annual buffer of mango trees that may not fruit each year.
Diversification across crops	Agarwood and mango have different maturity profiles, product markets, and harvest timing.
Mapped inventory and reporting	GPS-referenced reporting is maintained for audit purposes and to support Fund Manager reporting to professional investors; the company does not rely on a dashboard-based inventory reporting model.
No operational involvement required	Clients and investors are not expected to manage nursery, planting, harvesting, processing, or export activity themselves.

Leadership and Governance

The leadership team combines institutional finance, plantation execution, business development, forestry, and mango science. This mix is important because the company must be credible both as an operating agroforestry business and as a platform capable of engaging professional clients, strategic partners, and investors.

Director / Executive	Role	Strategic Contribution
Charles McKenzie	Chairman	Institutional investment leadership, governance perspective, and senior capital-markets credibility.
Mark Quinn	Chief Executive Officer	Plantation management, agribusiness development, Philippine operating experience, and platform execution.
Cord Kabus-Duprée	Director of Business Development	Investor engagement, family-office access, professional-client communication, and commercial development.

Marciano Gecolea	Agroforestry Director	Forestry and agarwood expertise, land suitability, cultivation discipline, and plantation-scale execution.
R.A.G. Ferdinand Domingo	Agri-Science Director	Mango cultivation, research, pre- and post-harvest systems, and yield-quality development.

Strategic Partnerships

Golden Forests is supported by strategic technical, operational, scientific, and commercial relationships that strengthen execution of the dual-crop platform. These relationships support planting material, crop science, inoculation technology, field execution, harvest preparation, market development, reporting, and professional-client distribution.

Partners	Partnership Area	Strategic Contribution
Thai Forestry Industry Organization	Inoculation technology	Supports access to a proven <i>Aquilaria crassna</i> inoculation formula and process for resin development, harvest planning, and agarwood commercialization.
PRMSU Regional Mango Centre	Mango science and cultivation	Supports Sweet Elena mango propagation, orchard establishment, crop management, harvesting, handling, sorting, and post-harvest quality control.
UPLB post-harvest science	Post-harvest science and quality control	Supports mango post-harvest handling, grading, packaging, quality systems, and commercial readiness for premium fruit channels.
PRMSU, VSU, UPLB, DENR and DOST	Research and technical validation	Strengthens crop science, cultivation discipline, plantation practices, regulatory awareness, and technical credibility with professional stakeholders.
Crassna Agroforestry Development Incorporated	Nursery and field operations	Supports Philippine plantation execution, permits, nurseries, land preparation, field supervision, mortality replacement, crop monitoring, and staged plantation expansion.
Market and buyer research relationships	Market development and buyer research	Supports pricing intelligence, buyer-channel development, oud wood chip sales preparation, premium mango channel development, and route-to-market planning.

Private placement intermediaries in the UAE, Switzerland, Germany, the Netherlands, Singapore and the UK	Professional-client distribution	Supports engagement with eligible professional clients, family offices, strategic partners, and private placement intermediaries where legally permitted.
--	----------------------------------	---

Sustainability and Impact

Golden Forests’ sustainability proposition is linked to cultivated supply, reforestation, biodiversity, local employment, and long-term land stewardship. In agarwood, cultivated and traceable production is particularly important because wild agarwood has been associated with overharvesting, illegal collection, and conservation pressure. A well-managed plantation model can support more responsible supply by reducing dependence on wild harvesting and improving documentation of origin.

The company also intends to integrate native-species reforestation and field-level environmental stewardship alongside commercial planting. Any carbon, biodiversity, or environmental-value statements should be treated as preliminary unless independently verified, certified, or documented under an appropriate framework. The strongest sustainability claim today is the company’s intention to build a legal, cultivated, traceable, and professionally managed agroforestry platform.

Impact Theme	Prospectus Positioning
Cultivated supply	Supports legal, documented production and reduces reliance on wild agarwood harvesting.
Reforestation ambition	Allows the business to integrate commercial planting with native-species and land-stewardship objectives.
Local employment	Creates field, nursery, maintenance, and post-harvest roles in operating regions.
Traceability	Improves stakeholder confidence by linking biological assets to documented field activity.

Additional impact metrics: Golden Forests’ materials reference a 1:1 native reforestation program, approximately 1.16 million tons of projected CO₂ sequestration over 25 years, potential carbon-credit upside, restoration of damaged land, and significant local employment creation over the long-term plantation plan. These should remain subject to verification, certification, and legal review before use in any regulated offer material.

Commercial Opportunity

The commercial opportunity is built around two deep but different natural-product markets. Agarwood addresses the luxury aromatic economy, where documented origin and legal supply are increasingly important. Mango addresses the premium fresh-fruit and export-agriculture economy, where quality, origin, sweetness, supply reliability,

post-harvest handling, and brand development matter. Together, these crops position Golden Forests as a differentiated natural-products company rather than a narrow plantation scheme.

Product and Market Pathways

Crop	Primary Product Pathways	Commercial Buyer Logic
Agarwood	Oud wood chips as the current commercial focus and basis for the illustrative agarwood income returns; other agarwood-derived products may be considered only as future optionality.	Specialist oud buyers value aroma profile, resin quality, origin documentation, legal trade compliance, and consistent cultivated supply.
Mango	Premium fresh fruit, export-quality mangoes, branded Philippine produce, selected domestic premium channels, and potential processed or value-added mango products subject to commercial feasibility.	Food buyers value sweetness, size, consistency, shelf life, packaging, provenance, post-harvest handling, and reliable supply timing.
Combined platform	Premium natural-products portfolio combining aromatic materials and branded agricultural produce.	Strategic partners can understand Golden Forests as a supply-chain and brand platform rather than a single-crop plantation project.

The opportunity is therefore not limited to crop ownership. Golden Forests is building the operating, technical, and commercial infrastructure required to convert biological assets into premium natural products: legal and traceable oud wood chips for specialist buyers, and high-quality Philippine mangoes for premium fresh-fruit channels. The illustrative return examples support this logic by showing how the two crops may contribute differently over time — mango through earlier recurring harvest income, and agarwood through a later oud wood chip harvest event.

Strategic Growth Roadmap

1. **Establish and validate the operating base:** continue nursery, planting, land-access, permitting, and team development in the Philippines.
2. **Scale the dual-crop platform:** increase planting and field-management capacity across agarwood and mango while preserving quality control.
3. **Strengthen traceability and reporting:** build investor-grade and partner-grade reporting around biological assets and field activity.
4. **Develop commercial channels:** prepare buyer relationships, post-harvest handling, logistics, and product-quality standards for both crops.
5. **Expand strategic partnerships:** engage professional clients, family offices, strategic agriculture groups, impact investors, and potential commercial partners.

6. **Build the Golden Forests brand:** position the company as a credible, responsible, premium agroforestry platform rather than a short-term plantation project.

Why Golden Forests

- **Clear dual-crop logic:** agarwood provides long-duration specialty-market exposure, while mango provides an earlier and more familiar premium food-crop story.
- **Operating orientation:** the company is focused on physical execution, nursery quality, planting, field management, and commercialization readiness.
- **Premium product positioning:** both oud and Sweet Elena mango can be presented as high-value natural products with strong branding potential.
- **Experienced leadership:** the team combines finance, agribusiness, forestry, mango science, and investor-development expertise.
- **Sustainability relevance:** the model supports cultivated supply, traceability, reforestation ambition, and responsible agroforestry discipline.
- **Investor-friendly narrative:** the business can be explained without relying on complex fund mechanics or detailed company financials.

Why Now and Next Steps

Golden Forests is being presented at a point where the core business proposition, operating geography, crop strategy, technical relationships, and investor materials have moved beyond a conceptual overview and into a more defined platform. The opportunity is timely because professional investors can review the dual-crop model before full commercial scale-up, while the company is still building the operating, reporting, and market-access infrastructure intended to support long-term value creation.

The appropriate next step for eligible professional clients, strategic partners, and prospective investors is therefore not to rely on this prospectus alone, but to use it as an introduction before reviewing the supporting due diligence materials, meeting management where appropriate, assessing the legal and tax structure, and confirming investor eligibility through the formal process.

Closing Summary

Golden Forests presents a clear professional-investor introduction to a real-economy agroforestry platform: two complementary crops, defined operating geography, credible technical relationships, a disciplined execution model, and a commercial pathway built around premium natural products. The prospectus is not intended to replace formal legal, financial, or tax due diligence, but it provides a concise basis for understanding the business, assessing the opportunity, and deciding whether to proceed to the data room and formal review process.

Due Diligence and Data Room

Detailed due diligence materials are available to eligible professional clients, approved reviewers, and prospective investors through the Golden Forests data room. These materials may include corporate documentation, permits, land-access records, nursery and planting information, technical references, crop assumptions, director CVs, financial summaries, draft legal documents, and supporting commercial materials. Access is subject to approval, confidentiality requirements, and applicable investor-eligibility checks.

Important Notice

This document is a business prospectus and discussion paper prepared for professional clients, strategic partners, and prospective investors in the company. It is not a regulated offer document, financial promotion, securities prospectus, private placement memorandum, subscription document, or recommendation to invest. It does not contain full legal, financial, tax, regulatory, operational, or risk disclosure. Any illustrative return examples, income figures, IRRs, multiples, crop yields, prices, timelines, reserve amounts, carbon figures, market-size references, growth-market statements, export-demand statements, certification references, or commercial assumptions are examples only and are not guaranteed. Actual outcomes may be materially different and would depend on plantation performance, product quality, market pricing, costs, fees, taxation, regulation, certification, documentation, and successful sales to third-party buyers. Any future investment opportunity would require separate definitive documentation and appropriate professional advice.

Appendix A — Subscription Pricing for Agarwood and Mango

This appendix summarizes the current illustrative subscription pricing mechanics for agarwood and mango. It is included for orientation only and should not be treated as final offering terms. Any formal subscription would be governed only by definitive legal documents, final fund documentation, investor eligibility checks, and applicable private-placement requirements.

Pricing Item	Agarwood Share	Mango Share
Unit basis	One share represents one tree-equivalent agarwood unit.	One share represents one tree-equivalent mango unit.
Illustrative Year 0 subscription price	USD 301.71 per tree-equivalent share.	USD 437.08 per tree-equivalent share.
Price escalation	3% annual subscription-price escalation for later subscription periods, subject to final documents.	3% annual subscription-price escalation for later subscription periods, subject to final documents.
Reserve / cost treatment	Includes USD 173.10 per share intended to be held as an agarwood reserve by the Fund Manager.	No separate upfront reserve is currently presented; future packaging, cold storage, export certification, audit, and related costs are expected to be deducted from harvest income.
Purpose of reserve / deductions	The agarwood reserve is intended to pre-fund inoculation, harvesting, extraction, and packaging.	Mango harvest-period expenses are expected to be deducted from gross mango harvest income before net investor distributions.
Harvest timing	Resin harvest expected to begin in Year 9 and complete in Year 10 under the current illustrative model.	Recurring fruit harvests expected to commence in Year 5 and continue through the current modelled fruiting period of 25 years.
Capital-call position	No capital calls are currently contemplated at any stage under the illustrative pricing model.	No capital calls are currently contemplated at any stage under the illustrative pricing model.

Important pricing note: Shares are presented as tree-equivalent units for investor allocation and economic modelling purposes. Investors would hold fund shares or other legally documented interests under the final structure, not individual trees or direct plantation assets. The final treatment of reserves, deductions, commissions, pricing escalation, investor eligibility, and distributions must be confirmed by legal counsel and definitive documents.

Appendix B — Director Biographies

Full director CVs and supporting professional biographies are available in the data room for eligible professional clients and approved reviewers.

Charles McKenzie — Chairman

Charles McKenzie provides senior leadership, governance oversight, and institutional investment perspective to Golden Forests. His role is to help position the company credibly with professional clients, strategic partners, and investors, while supporting the development of a disciplined board-level framework for decision-making, reporting, and long-term capital stewardship.

- Provides board-level governance and senior strategic oversight.
- Supports institutional positioning with professional clients and strategic partners.
- Brings capital-markets perspective to long-term platform development.
- Helps guide reporting discipline, investment governance, and capital stewardship.

Mark Quinn — Chief Executive Officer

Mark Quinn leads the company's operating strategy and day-to-day platform development in the Philippines. His contribution is centered on converting the agroforestry thesis into practical execution: land access, nursery development, field operations, planting programs, local partnerships, and the commercial structure required to scale Golden Forests from a promising concept into a managed operating business.

- Leads Golden Forests' Philippine operating strategy and platform execution.
- Oversees land access, nursery development, field operations, and planting programmes.
- Coordinates local partnerships, permitting progress, and operating-company development.
- Focuses on converting the agroforestry thesis into practical plantation execution.

Cord Kabus-Duprée — Director of Business Development

Cord Kabus-Duprée supports Golden Forests' investor engagement, strategic relationship development, and professional-client communication. His role is to help translate the company's operating story into a clear commercial proposition for family offices, professional investors, strategic partners, and future distribution or capital relationships.

- Leads investor engagement, relationship development, and professional-client communication.
- Supports access to family offices, strategic partners, and professional investor networks.

- Helps translate the operating platform into a clear commercial and investment narrative.
- Contributes to capital-raising preparation, distribution relationships, and strategic outreach.

Marciano Gecolea — Agroforestry Director

Marciano Gecolea brings forestry and agarwood expertise to the platform. His work supports land suitability assessment, crop selection, planting design, field supervision, and the technical discipline required for a cultivated agarwood strategy. This role is central to ensuring that the company's long-duration agarwood opportunity is grounded in practical agroforestry execution.

- Provides forestry and agarwood expertise for the cultivated *Aquilaria crassna* strategy.
- Supports land suitability assessment, crop selection, planting design, and field supervision.
- Guides technical execution for agarwood planting, monitoring, and harvest readiness.
- Strengthens the company's technical credibility in plantation-scale agarwood development.

R.A.G. Ferdinand Domingo — Agri-Science Director

R.A.G. Ferdinand Domingo supports the company's mango science, orchard-development strategy, and crop-quality systems. His role includes guidance on mango cultivation, pre-harvest and post-harvest practices, tree health, yield development, and quality standards. This expertise strengthens the Sweet Elena mango component of the dual-crop strategy and helps make the platform commercially credible beyond agarwood alone.

- Provides mango science and orchard-development expertise.
- Supports Sweet Elena mango cultivation, pre-harvest systems, and post-harvest quality discipline.
- Guides tree health, yield development, fruit quality, and harvest-readiness practices.
- Strengthens the premium mango component of the dual-crop platform.
